

- groundwater by leaching of contaminants from waste and soil to groundwater and vertical and lateral migration of contaminants within leachate and groundwater;
- on-site property by direct contact with contaminants in soil, leachate and shallow groundwater.

Pollutant Linkages

Contaminants, pathways and receptors have been further evaluated to identify instances where all three elements (contaminants, pathways and receptors) exist together and form a pollutant linkage. The conceptual model developed for these contaminants should be regarded as complete and accurate as it can be based upon the currently held information.
